Admin Club Oversight

Problem Statement

What challenge does CampusConnect solve?

- ✗ No centralised platform for students to discover and join campus clubs
- ✗ Manual, error-prone processes for membership requests & approvals
- ✗ Coordinators lack tools to manage activities and track attendance
- ✗ No controlled announcement channel — students miss important updates
- ✗ Admins have no oversight dashboard for club approvals and statistics

Our Solution — CampusConnect

A full-stack Spring Boot + React platform with role-based access for Students, Coordinators & Admins.

Student

- Browse approved clubs
- Submit join requests
- Register for activities
- View personalised feed

Coordinator

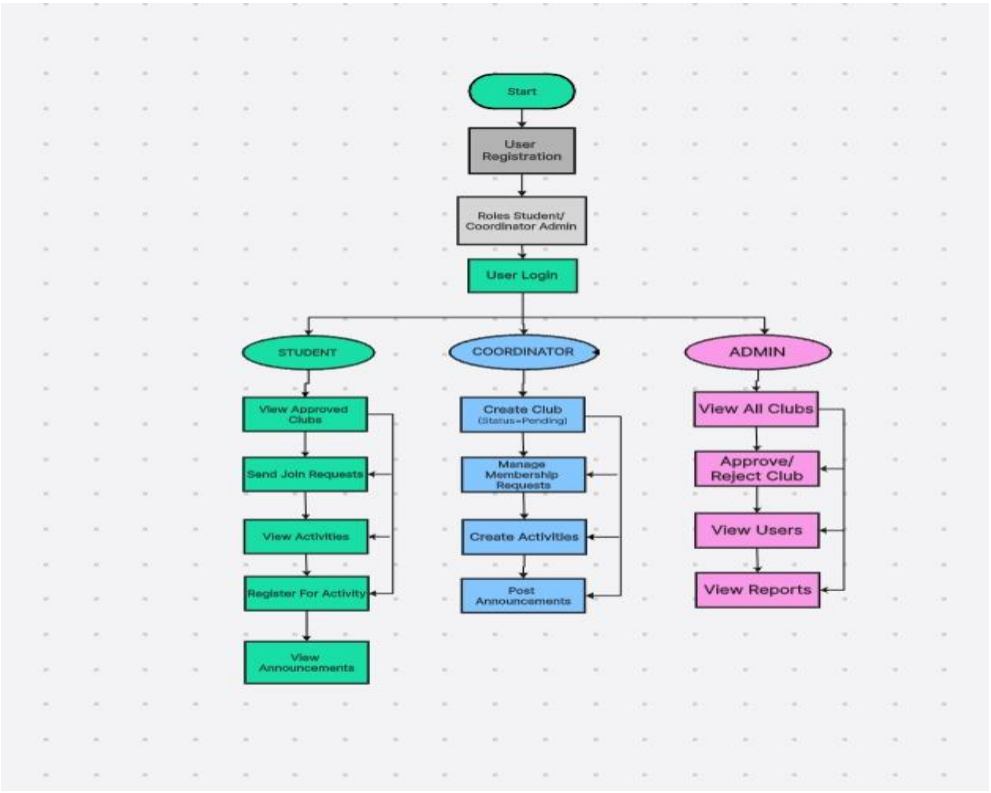
- Create & manage clubs
- Approve memberships
- Post activities
- Broadcast announcements

Admin

- Approve/reject clubs
- View all users
- Platform reports
- Full oversight control

System Flowchart

Complete user journey from registration to role-based actions



1 **User Registration**

Any user registers with role: Student, Coordinator, or Admin

2 **User Login**

Authenticated via JWT. Role determines which dashboard loads

3 **Student Actions**

View clubs → Send join request → View activities → Register → View announcements

4 **Coordinator Actions**

Create club → Manage memberships → Create activities → Post announcements

5 **Admin Actions**

View all clubs → Approve/Reject → View users → View reports

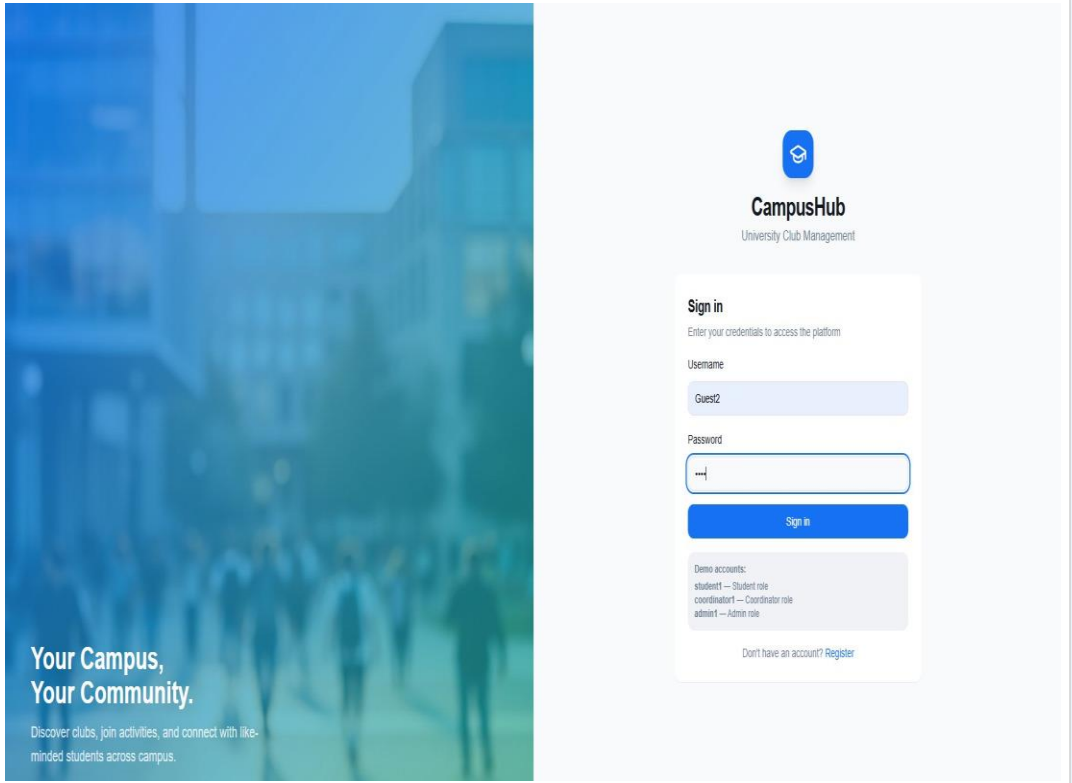
User Authentication & Security Service | FR-07

OUTPUT

Login Page — JWT-based Authentication



How It Works

What this service does

Handles user registration & login for all 3 roles: Student, Coordinator, and Admin.

JWT Token Security

On login, a JWT token is issued and stored. Every API call sends this token for identity verification.

Role-Based Route Protection

Spring Security guards each endpoint — students, coordinators & admins only see their own routes.

Key API Endpoints

POST /api/user/register → Register user
POST /api/user/login → Issue JWT token

Entity: User.java

Fields: id, username, password, email, role (STUDENT / COORDINATOR / ADMIN)

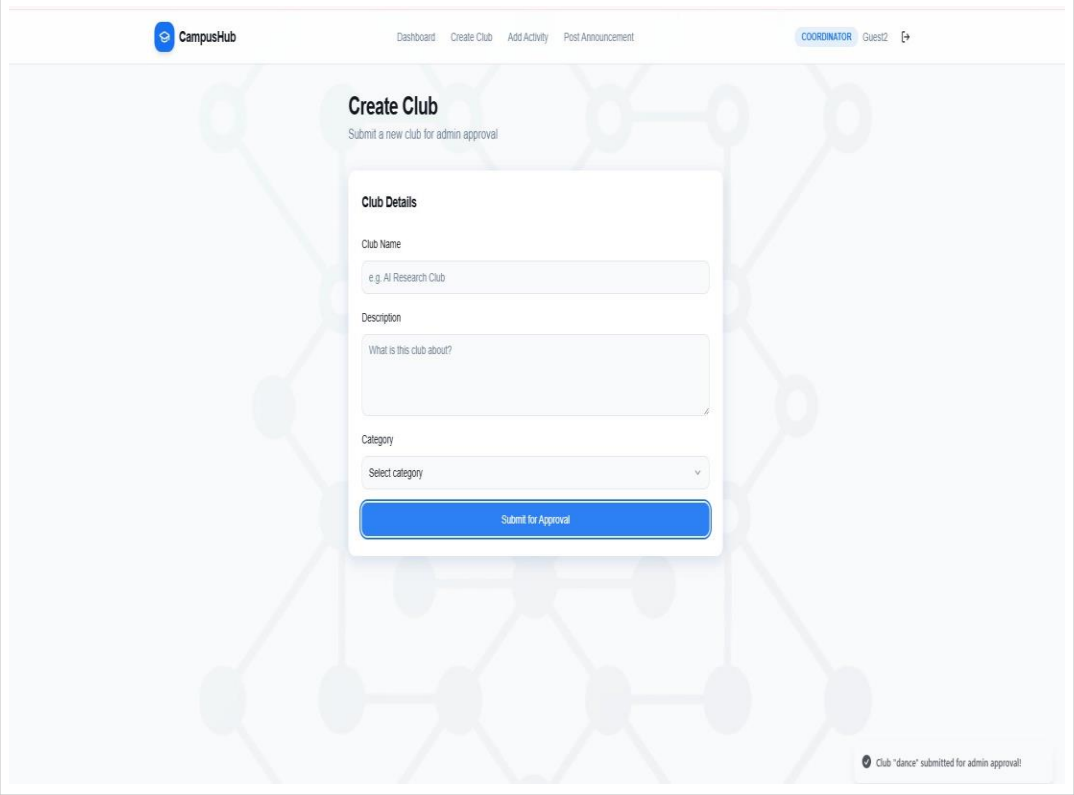
02

Shaik Sabiha Tasleem

Club Creation & Approval Service | FR-01, FR-07

OUTPUT

Create Club Form — Submit for Admin Approval



How It Works

What this service does

Owns the Club entity and its full lifecycle from creation to admin approval.

Club Status Flow

A new club starts as PENDING. Only after admin approval does it become APPROVED and visible to students.

Coordinator Control

Only logged-in coordinators can create clubs. The system links the club to its coordinator automatically.

Key API Endpoints

POST /api/coordinator/club → Create club (PENDING)
GET /api/student/clubs → Browse APPROVED clubs only

Entity: Club.java

Fields: id, name, description, category, status (PENDING/APPROVED/REJECTED), coordinator

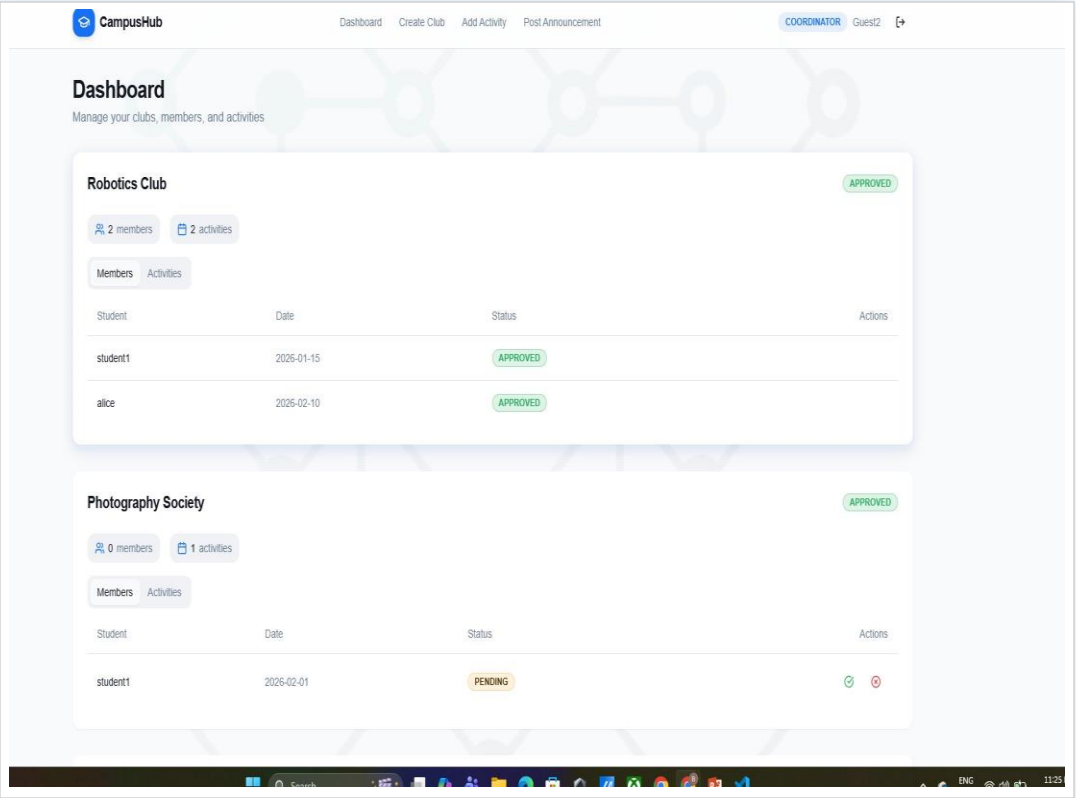
03

S. Udaya Sri

Membership Request & Approval Service | FR-02, FR-03

OUTPUT

Coordinator Dashboard — Manage Members & Requests



How It Works

What this service does

Manages the two-step join workflow: students request → coordinator approves or rejects.

Duplicate Prevention

The system checks if the student already has a pending or approved membership for the same club before allowing a new request.

Coordinator Dashboard

Coordinators see all members (APPROVED) and pending requests in one view, with approve/reject action buttons.

Key API Endpoints

POST /api/student/join → Student requests to join
PUT /api/coordinator/membership/{id} → Approve or reject

Entity: Membership.java

Fields: id, student, club, requestDate, membershipStatus (PENDING / APPROVED / REJECTED)

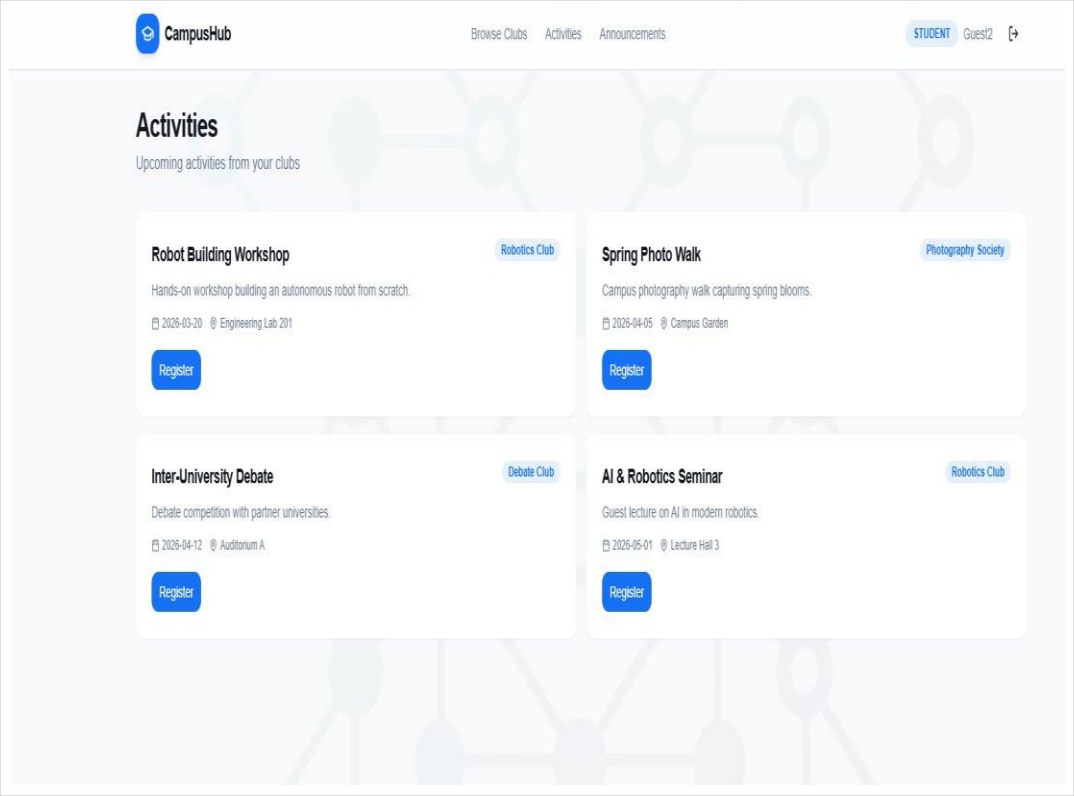
04

Bitni Faziya Khanam

Activity Management Service | FR-04

OUTPUT

Activities Page — Upcoming Club Events



How It Works

What this service does

Coordinators schedule activities under their clubs. Students browse all upcoming activities sorted by date.

Ownership Validation

Before an activity is created, the system confirms the coordinator actually owns that club — no unauthorized posting.

Chronological Sorting

Activities are always returned sorted by activityDate ascending so students see upcoming events first.

Key API Endpoints

POST /api/coordinator/activity → Add activity
GET /api/student/activities?clubId= → Browse activities

Entity: Activity.java

Fields: id, title, description, activityDate, venue, club (linked to Club entity)

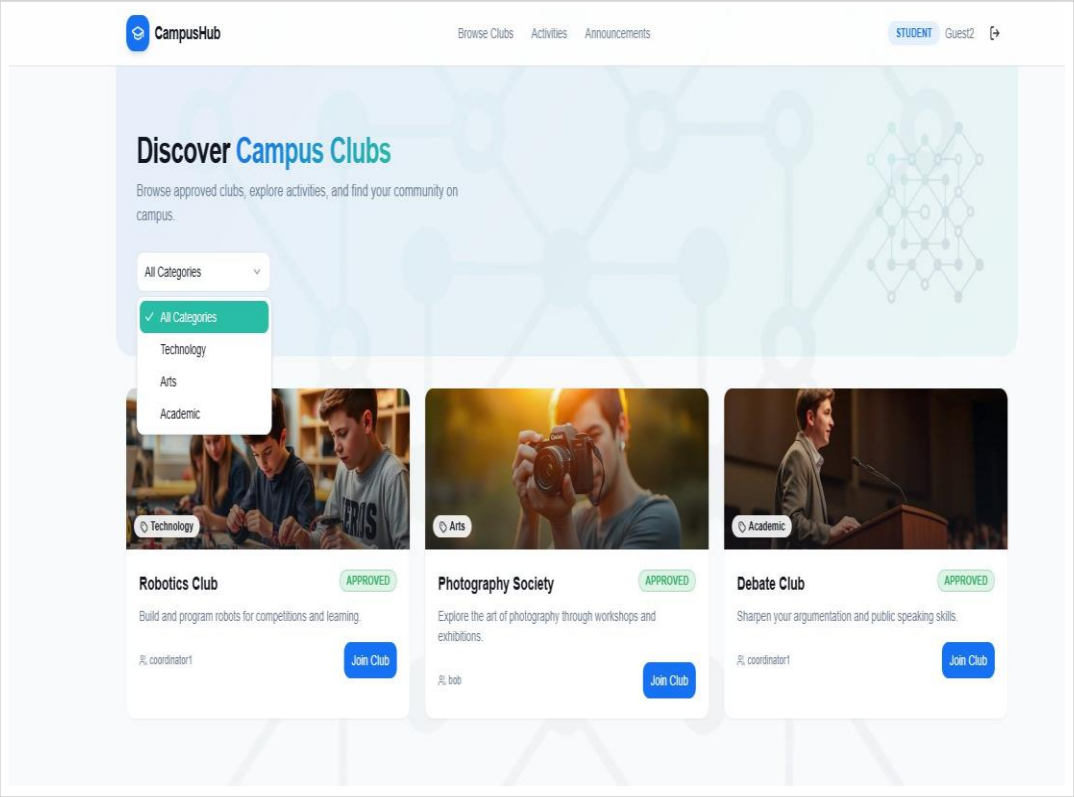
05

G. Vijay

Activity Participation Service | FR-05

OUTPUT

Browse Clubs — Discover & Filter by Category



How It Works

What this service does

Lets students register for activities in advance and coordinators mark actual attendance after the event.

Duplicate Registration Check

The system prevents a student from registering twice for the same activity — one registration per student per activity.

Attendance Tracking

After an event, the coordinator marks each registered student as attended (true/false) to record real participation.

Key API Endpoints

POST /api/student/participate → Register for activity
PUT /api/coordinator/participation/{id} → Mark attendance

Entity: Participation.java

Fields: id, student, activity, registrationDate, attended (boolean flag)

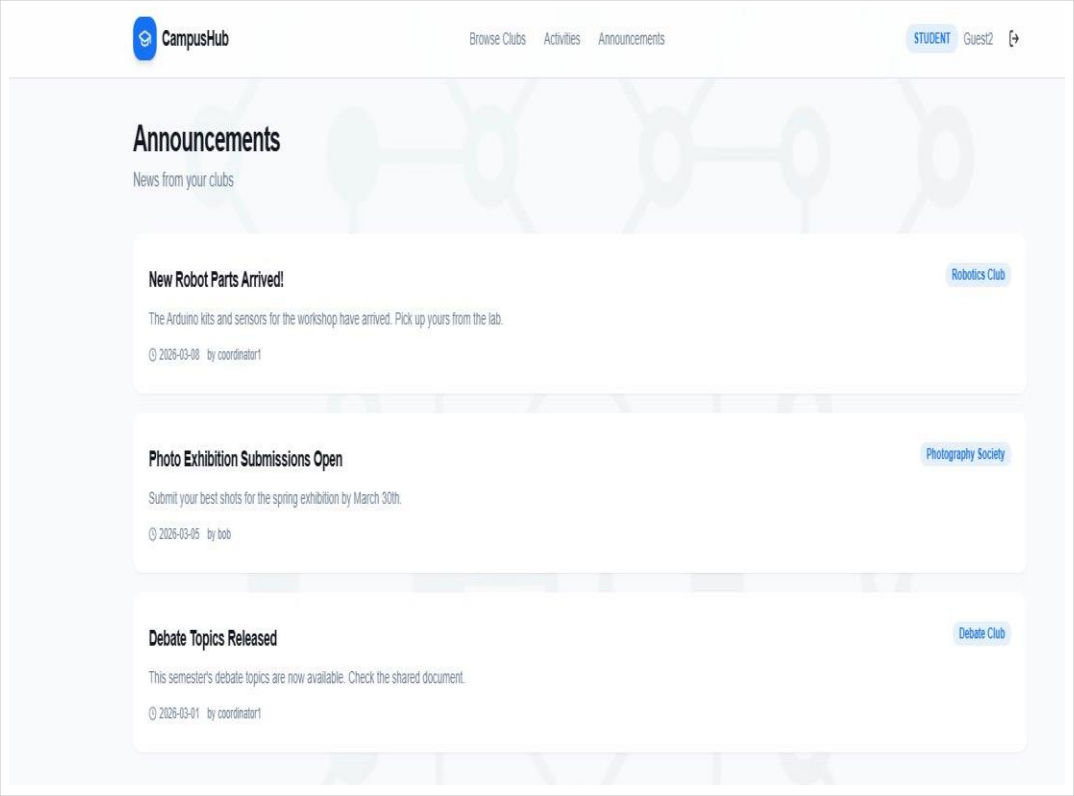
06

P. Rajesh

Announcement Service | FR-06

OUTPUT

Student Announcements Feed — News from Your Clubs



How It Works

What this service does

Coordinators post announcements to their club. Students receive a personalised feed from clubs they've joined.

Personalised Feed Logic

The feed queries only clubs where the student has an APPROVED membership — no irrelevant announcements.

Newest First Sorting

Announcements are always sorted by postedDate descending so students see the most recent news at the top.

Key API Endpoints

POST /api/coordinator/announcement → Post to club
GET /api/student/announcements?studentId= → Get feed

Entity: Announcement.java

Fields: id, title, content, postedDate, club, postedBy (coordinator User reference)

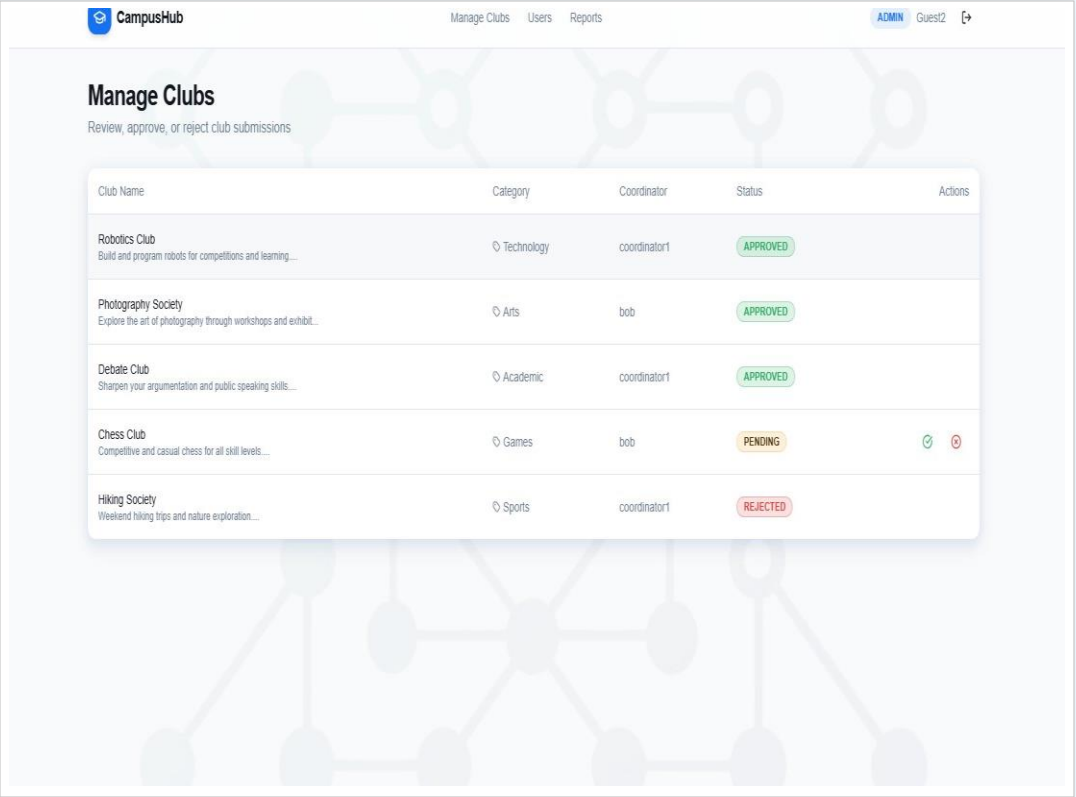
07

B. Pavan

Admin Club Oversight Service | FR-07

OUTPUT

Admin Panel — Manage Clubs, Users & Reports



How It Works

What this service does

Gives admins complete visibility and control — the gatekeeper that decides which clubs students can discover.

Club Approval Gate

Admins review PENDING clubs and approve or reject them. Only APPROVED clubs appear in the student browsing view.

User Management

Admins can view all registered users along with their roles (Student, Coordinator, Admin) across the platform.

Platform Reports Dashboard

Real-time stats: Total Users, Total Clubs, Active Members, and Total Participations — all in one view.

Key API Endpoints

PUT /api/admin/club/{id}?status= → Approve/Reject
GET /api/admin/reports → Platform statistics

Technology Stack

Tools and frameworks powering CampusConnect

Backend

- Spring Boot 3.x
- Spring Security + JWT
- Spring Data JPA
- MySQL Database
- Maven Build
- REST APIs

Frontend

- React.js
- React Router DOM
- Axios HTTP Client
- Context API (Auth State)
- CSS / Tailwind
- Component-Based UI

Architecture

- Microservice Pattern
- Role-Based Access Control
- JWT Token Auth
- RESTful API Design
- Entity-Relationship Model
- Separation of Concerns

Conclusion

Why CampusConnect Matters

One Unified Platform

Students, coordinators, and admins all work in one connected system — no scattered spreadsheets or manual emails.

Faster Approvals

Automated membership and club approval workflows reduce wait times and eliminate human error in tracking requests.

Personalised Experience

Students only see clubs they've joined, activities relevant to them, and announcements from their own clubs.

Admin Visibility

Admins gain a real-time dashboard with platform-wide stats — total users, clubs, memberships and participations.

Secure Role Access

JWT-based authentication and Spring Security role guards ensure every user only accesses what they're allowed to.

Scalable Architecture

Microservice design means each feature can grow independently — ready for a real university deployment.

Thank You!
